Thermodynamique des systèmes ouverts P1 - Chapitre 6

Définition des grandeurs massiques

$$u = \frac{U}{m} \qquad e = e_c + e_p + u \qquad e_c = \frac{v^2}{2} \qquad e_p = gz \qquad \boxed{h = u + \frac{P}{\mu}} \qquad \boxed{P = \mu rT} \qquad \boxed{r = \frac{R}{M}}$$

II. **Bilans**

| Bilan de | Equation |
|--------------------------|---|
| Masse | $\overline{rac{dM}{dt}} = D_{me} - D_{ms}$ $D_m = \mu S v$ $D_m 	ext{ (kg. s}^{-1}) : 	ext{ d\u00e9bit massique}$ |
| Energie | $\frac{dE}{dt} = \left(e_e + \frac{P_e}{\mu_e}\right) D_{me} - \left(e_s + \frac{P_s}{\mu_s}\right) D_{ms} + \mathcal{P}_u + \mathcal{P}_{th}$ $\frac{dE}{dt} = \left(\frac{v_e^2}{2} + gz_e + h_e\right) D_{me} - \left(\frac{v_s^2}{2} + gz_s + h_s\right) D_{ms} + \mathcal{P}_u + \mathcal{P}_{th}$ |
| Entropie | $\frac{dS}{dt} = s_e D_{me} - s_s D_{ms} + \frac{\mathcal{P}_{th}}{T_a} + \frac{\delta S^p}{dt}$ |
| Quantité de mouvement | $\frac{d\vec{p}}{dt} = \overrightarrow{v_e} D_{me} - \overrightarrow{v_s} D_{ms} + \overrightarrow{F_{ext}}$ |

Si x est en régime permanent, $\frac{dx}{dt} = 0$
